ANIMAL CARCASSES:

Proper disposal of animal carcasses is important to prevent the transmission of disease and to protect the environment. This includes carcasses of livestock, poultry, game animals, wildlife, birds, pets, and other animals.

Proper carcass disposal is also important to avoid possible contamination of any body of water including shallow water tables.

BIOLOGICAL DISPOSAL WITH ERGOFITO:

Ergofito group of natural bacteria will safely dispose of any animal carcass in the environment as well as transforming the carcass into humus, which is beneficial to the environment.

The disposal can be done in two ways:

- The first is to spray the carcass with **Ergofito Car**, then bury the carcass in a shallow grave.
- The second is to spray the carcass with **Ergofito Car** then cover the carcass with 30 cm of soil.

In both cases any emanating odour will be immediately be eliminated, thus avoiding predators trying to reach the said carcass.

Decomposition will immediately commence avoiding leaching and insect's attraction.

The bacteria will transform the carcass into CO² and Humus, which form part of the natural environment.

Ergofito Car will suppress all the conditions conducive to illnesses usually associated with flesh decomposition. No other product additions are necessary.

The bones will be rapidly denuded of all flesh. They will take a long time to decompose, it is advisable to dispose of the then clean bones mechanically and use it in a fertilization program.
